

Bugs found: 4

1. Uninitialized variable: 'x' is used in printf without being assigned a value, producing undefined behavior.
2. Off-by-one error: the loop condition 'i <= 5' allows i to reach 5, writing past the end of the 5-element array 'arr' (valid indices are 0-4).
3. Buffer overflow: strcpy copies "HelloWorldExtra" (15 chars + null terminator) into 'buf', which is only 10 bytes, overflowing the buffer.
4. Memory leak: the memory allocated with malloc for 'arr' is never freed before the function returns.
