

Bugs found: 3

1. Out-of-bounds write: the loop iterates `i` from 0 to 11 (12 iterations), but the array `arr` has only 10 elements, causing writes beyond its bounds.
2. Uninitialized variable: '`x`' is read in the condition '`if(x > 0)`' without ever being assigned a value, resulting in undefined behavior.
3. Missing null terminator: the string `s` is declared as `char s[8]` and initialized with "`abcdef`" (7 chars + null terminator filling the array), then `s[7]` is overwritten with '`Z`', eliminating the null terminator and causing undefined behavior in `printf`.
