

Bugs found: 5

1. Buffer overflow in malloc: only 16 bytes allocated but strcpy writes 19 bytes ("BufferOverflowTest" + null terminator).
2. Buffer overflow in memcpy: dest is only 8 bytes but 16 bytes are copied into it, overflowing the stack buffer.
3. Use of uninitialized variable: x is declared but never initialized before being used in the division $x / 0$.
4. Division by zero: $y = x / 0$ performs an explicit division by zero, causing undefined behavior and likely a crash.
5. Double free: data is passed to free() twice, causing heap corruption and undefined behavior.
