

Bugs found: 5

1. Pointer arithmetic creates an out-of-bounds pointer with 'p + 15' on a 10-element allocation.
2. Dereferencing 'q' writes outside the allocated memory block.
3. Dereferencing 'p' after 'free(p)' causes a use-after-free access.
4. The loop writes past the end of 'str' because it iterates 6 times for a 5-byte array.
5. The string in 'str' is not null-terminated before passing it to printf with '%s'.
