

Bugs found: 5

1. The array 'nome' is declared with size 4 but no null terminator is included, making it an invalid C string.
2. The for loop condition uses ' ≤ 3 ' ($i \leq 3$), which is correct for indexed access but combined with the missing null terminator means any string function use would cause undefined behavior.
3. Division by zero: ' $x = 10 / 0$ ' causes undefined behavior and a fatal runtime crash.
4. The variable 'x' is assigned the result of a division by zero but is never used, making it a dead/unused variable.
5. The printf loop does not print a newline character after the name, leaving the output without proper line termination.
