

Bugs found: 6

1. The result of malloc for p is not checked before p is dereferenced.
2. q is assigned to p and becomes a dangling pointer after free(p).
3. q[2] writes to memory after it has been freed.
4. q[2] writes out of bounds because only two int elements were allocated.
5. malloc(10) allocates 10 bytes for x instead of space based on sizeof(int).
6. The memory allocated to x is never freed.
