

Bugs found: 3

1. Potential deadlock: two threads acquire lock1 and lock2 in opposite orders, which can cause each thread to wait indefinitely for the other to release its held lock.
2. Null pointer dereference: 's' is explicitly set to null and then 's.toString()' is called on it, which will throw a NullPointerException at runtime.
3. Integer overflow: adding 100 to Integer.MAX_VALUE causes arithmetic overflow, wrapping around to a large negative value instead of the expected result.
