

Bugs found: 4

1. Static memory leak: the static 'leak' list holds a reference to an Object indefinitely, preventing garbage collection for the lifetime of the class.
2. ConcurrentModificationException: 'list.add("b")' attempts to structurally modify a list while iterating over it with a for-each loop, which throws a ConcurrentModificationException at runtime.
3. UnsupportedOperationException: 'Arrays.asList()' returns a fixed-size list that does not support 'add()', so calling 'list.add("b")' would throw an UnsupportedOperationException even without the concurrent modification issue.
4. ClassCastException: the variable 'o' holds an Integer value (auto-boxed from 42) but is cast to String, which throws a ClassCastException at runtime.
