

Bugs found: 5

1. Potential deadlock: t1 locks `String.class` then `Integer.class`, while t2 locks `Integer.class` then `String.class` — opposite lock ordering causes circular wait.
2. `ConcurrentModificationException`: modifying the `ArrayList` (`l.remove(0)`) while iterating over it with a `for-each` loop is illegal.
3. Iterating over an empty list and calling `l.remove(0)` will throw `IndexOutOfBoundsException` if the list ever had elements added, and the loop body is unreachable on an empty list — logic error.
4. Threads t1 and t2 are never joined, so the main thread may exit before they complete, leaving thread behavior undefined.
5. Synchronizing on shared class literals (`String.class`, `Integer.class`) is a bad practice that can interfere with other unrelated synchronized blocks in the JVM.
